a note

what you find easy might not be easy for others

be nice

what's different between s1 and s2?

```
#include <stdio.h>

char *s1 = "abc";

int main(void) {
    char *s2 = "def";
    // ...
}
```

command line arguments

In groups, write a program called "print_arguments" that prints out its command line arguments. What does your program output when you run `print_arguments COMP1521 24T1`

If you get time, write another program to find the sum of integer arguments e.g `sum_arguments 1 2 3 4 5` should print out "15"

steps of compilation

- pre processor - replaces #includes and #defines. - `-E`
- compiler - produces assembly for the targetted machine - `-S`
- assemble - produce machine (binary) code - `-c`
